Annotation: this article expresses the advantages of school educational organizations learning a second language at an early age, relevance and, of course, ways to use modern interactive methods for the implementation of this minister.

Keywords: motivation components, interactive, styles, competence.

The process of traveling around the world is in criticism of the fact that people learn foreign languages from their native language several more times. Current research indicates that it will be effective to start this process at an early age. In our country, too, there is a strong emphasis on this issue, the study of foreign languages in the development of programs on the basis of a new direction in the cooperation of leading Tashkent and universities in the world. In the era of globalization, when international relations have developed, knowledge of a foreign language is a large political-cultural process. Abu Rayhan Beruniy, Abu Nasr Farabi, Beruniy, Ibn Sina, who are among our famous scholars, knew perfectly for several years. Link to the raw age periods of language learning. Psychologists believe that children make language faster and easier for adults. Language learning in children is a natural predisposition, the fact that they have a strong mimicry characteristic, the abundance of children's time than in adults are the main reasons for this. It should be taken into account that young children cannot explain the meaning of Information, remember it mechanically. World science has expressed a unanimous opinion on the easy slimming of a child's foreign language at the age of 10 years. During this period, the child is not understood the language, so it is easier to apply a foreign language and take it. But it happens that considering that the child was born with the ability to imitate the goods of any language, those who intend to start this process earlier, the ham is the majority.

On the research carried out in the study of human activity, it is reported that the period from the birth of a baby to the age of three is the most important period for the development of a child. It is that the brain of three young children is twice as fast as the brain activity of an older person, and good performance has been found. That is why, according to English experts, recognizing a second language as early as the first year of a child will be an easy replacement for it. But in any situation, we must not unit that taking into account the psychological and linguistic ability of ham bolan is finally an important factor. My opinion is that it would be advisable for our children to teach in such places: - sing letters or combinations that are difficult to understand or remember behind songs and songs that have no meaning; - reading with games that are a garden with mind and physical effort; - a collection of films.

Children's language does not understand the statements in the cartoon during learning behind the actions of cartoon characters, they seek to understand the words they are working on; - there can also be an exhibition, different pictures, fairy tales, books, and the same kind of things. All the basic components of learning English (teaching purpose, methods and tools, reading science content) consist of the skills of a close link, the creation of the basics of learning English, a free statement of one's own opinion and conducting a conversation in simple means of communication. It follows from this that the issue of expanding and highlighting the content of education and its abandonment, implementation of the activity of creativity, which constitutes the benefit, examination and qualification of this content, as well as the inclusion of educational and environmental issues in the ratio is of great importance. In the educational process, speech activity is listened to, which manages to shake its skills, consisting of reading, speaking, reading and writing. That is why didactic games play an important role in the process of introducing ham garden children to communication in English. Such games tied children to retirement, pleasure, hozor, roxat and sigh, balkim is an infinitely interesting game in learning English. With the help of this activity, they socialize in stages. The games reflect the stable traditions of the Uzbek people, how the norm is. There are a number of didactic cases typical of games. They are: * the development of independent activities for children on games in pedagogy will be a quality example; • games are a free shock of children's

activities-undoubtedly, in this process they realize the environment, those who have learned, those who have the question conditions for personal creativity activities, independent information and accelerate their activities; * games are a development process for children; * in the jaroyon of games, children are those who create while relying on Reason, show their capabilities and creativity activists. In conclusion, it can be said that in World psychology and pedagogy, based on the child's data, it is possible to know the following considerations with perfect confidence. Team, those who were brought up in preschool Tashkent, didactic games and Information Technology in the study of the English language will pass the information for sale.
